Inventory Receiving & Stock Guide

A practical guide to receiving deliveries, continuing partial receipts, finding stock, and explaining quantity changes. Use the actions available to your role. Screenshots show test items and deliveries; the numbers are examples.

Read this guide in Help & Guides, or download it for reference. No sign-in steps are included.

1 Open the right delivery

Choose **Inventory > Receive Inventory**, then open the correct pallet or delivery. Check its vendor, reference, and manifest before receiving anything. Use the delivery name and reference to avoid starting a second receipt for the same shipment.

Receive Inventory: verify the delivery and work through its manifest.

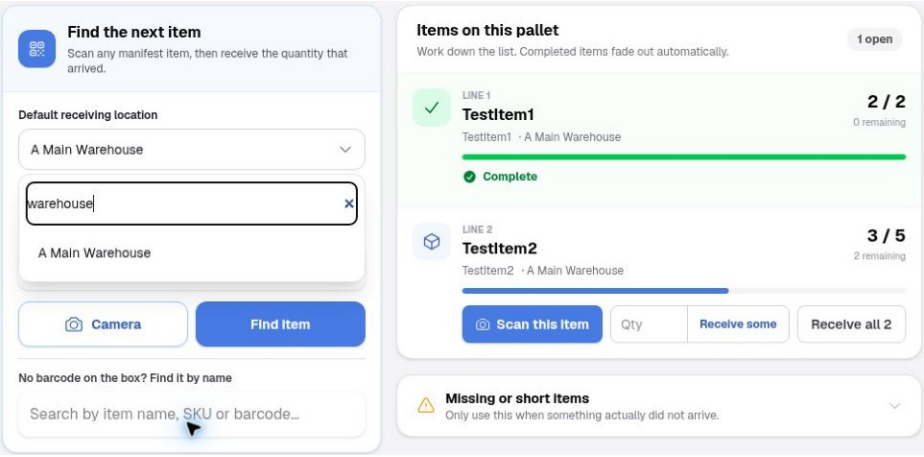

- Confirm the product on each line, the expected case count, units per case, and unit cost. A case count and an individual unit count are different.

- Choose the receiving location where the stock physically lands. Use search in the location picker rather than scrolling through every location.

- Record missing or uncertain costs for review; do not invent a cost just to finish the receipt.

2 Match an item, then receive its quantity

Scan or enter the item barcode on the receiving page. Check the matched product and manifest line before confirming a quantity. You may work through items in any order; the scanner does not assume the delivery follows the manifest order.

Receiving location picker: type part of a location name to narrow the list.

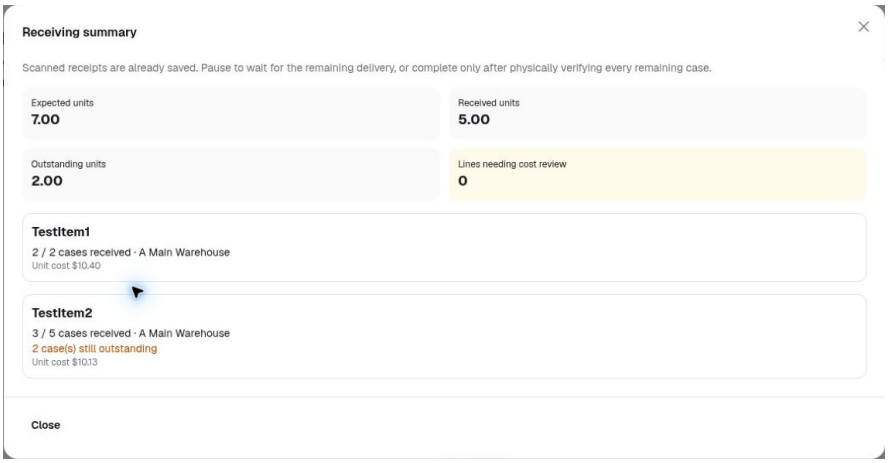

- If the barcode matches an item, confirm that it is the product you are holding. A scan can identify the line without receiving stock by itself.

- Enter the number of cases being received for that line, then use the receive action. Check the success message and updated quantity before repeating it.

- If the product is not matched, use the line product picker and search by name, SKU, or barcode. Confirm the match before adding stock.

3 Receive part now and resume later

Receive only the cases that actually arrived. Unreceived cases remain outstanding. Leave the delivery in progress when another part of the shipment is expected; do not mark missing stock as received.

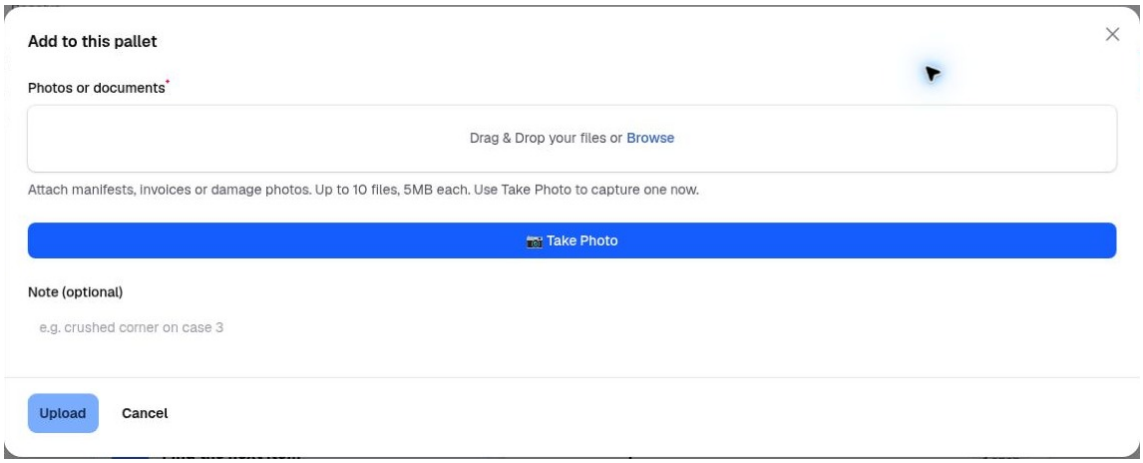

Review receiving shows confirmed units, outstanding quantities, discrepancies, and costs.

- Use **Review receiving** to inspect the summary without crediting more inventory. Complete the delivery only after the quantities and any genuine shortfall have been resolved.

4 Keep delivery documents with the record

Use **Add manifest, invoice or photos** on the receiving page. Attach the packing list or invoice and any damage photos, then add a short description. Check that the files appear on the delivery after saving.

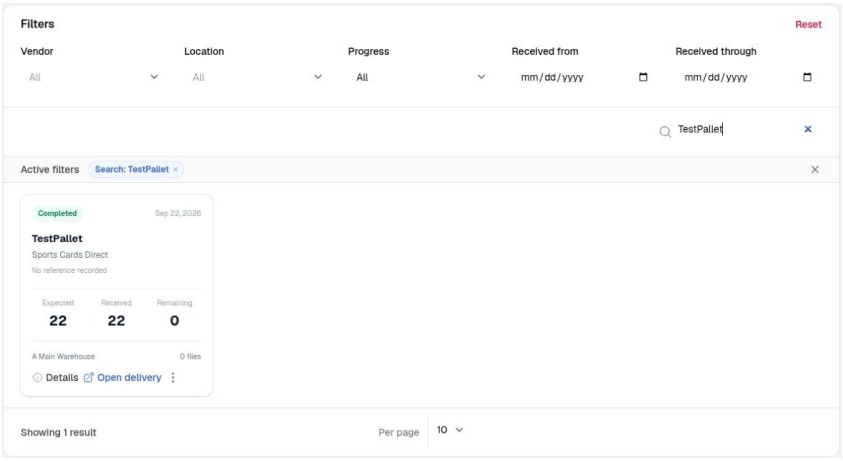

Attach delivery evidence to the existing receiving record.

- Supported delivery attachments include images and PDFs. The upload control allows up to 10 files, with a 5 MB limit for each file.

- Keep supplier documents and damage evidence on the correct delivery so another teammate can understand the receipt later.

5 Find and reopen an unfinished delivery

Open **Receiving History** from Receive Inventory or the dashboard shortcut. Search by delivery name, reference, or vendor. Use the progress, date, vendor, and location filters to narrow the records.

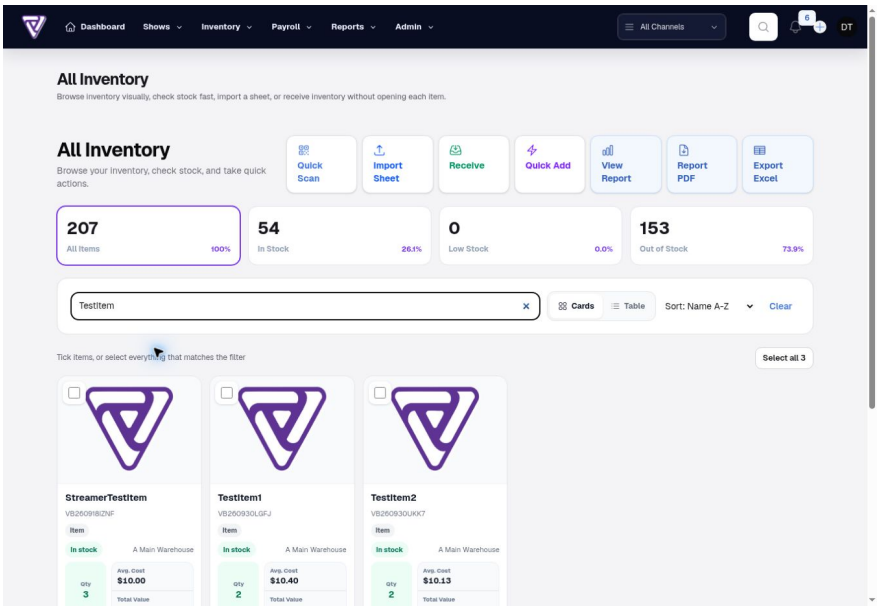

Receiving History: compact cards keep expected, received, and remaining cases together.

- Choose **Details** for the side drawer, or **Open delivery** for the full record. For an unfinished receipt, choose **Resume receiving** in its details or actions menu.

- Use **Export CSV** to download the currently filtered results. Summary cards describe the receiving history scope; they are not a count of only the search results.

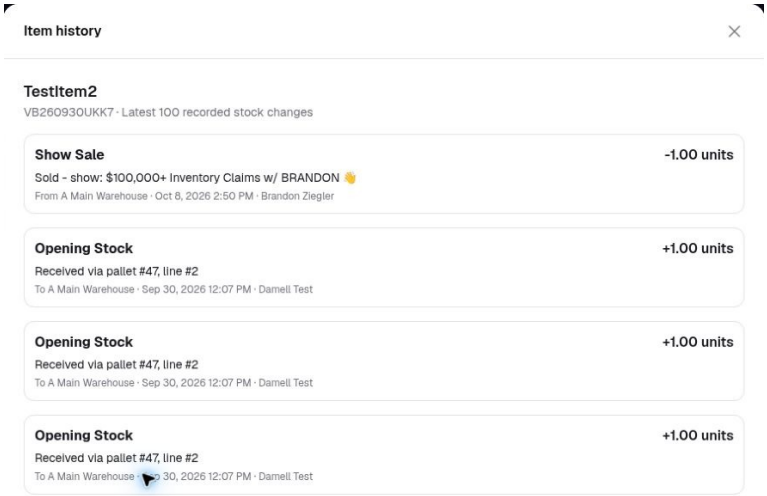

6 Find inventory and read its history

Choose **Inventory > All Inventory**. Search by barcode, SKU, or product name, then inspect the quantity, location, average cost, and total value on the matching card. Check the exact product before making a stock change.

All Inventory: search first, then check the matching item and its location.

Choose **History** on the item card to open the history drawer. Review receipts, transfers, corrections, and recorded show usage without leaving the list. Read the dates, reasons, and quantities to understand how the current count was reached.

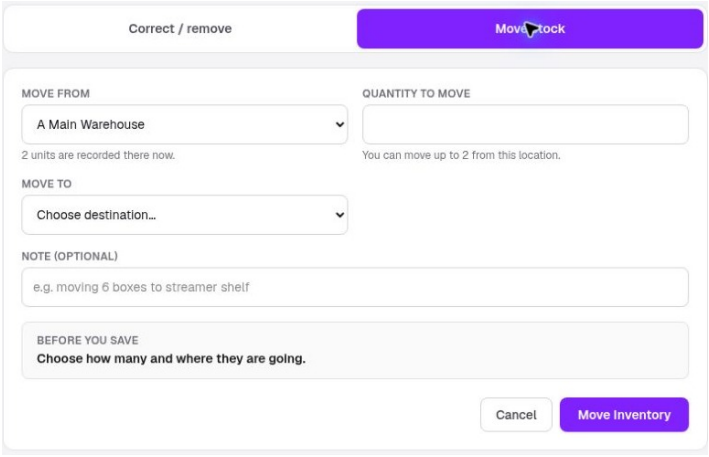

The item history drawer explains recorded stock movements.

- Use **Inventory Log** in the menu when you need to inspect movement records across several items.

- If a save fails or its result is unclear, re-check the delivery or item history before repeating an action. A success message and an updated record are the confirmation that matters.

7 Move stock between locations

On the item card, choose **Stock** to open **Move or correct stock**, then choose **Move stock**. Select the source location, enter how many units are moving, select the destination, and add a useful note. Review **Before you save**, then choose **Move Inventory** when ready.

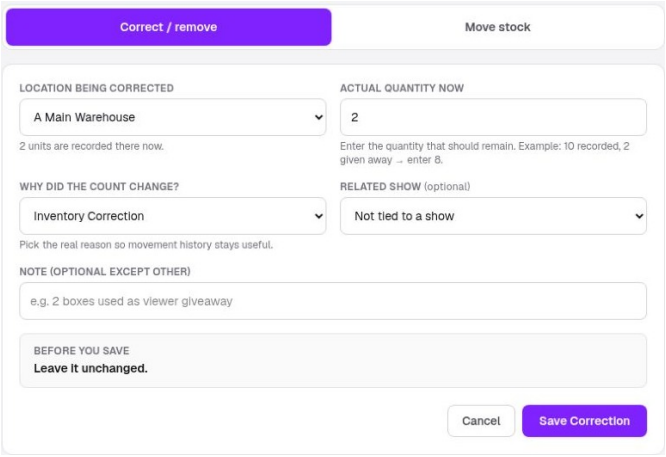

Move stock changes locations. It does not create an extra delivery.

- The source and destination must be different. Move only stock that physically exists at the source. Check the available quantity first.

8 Correct a count or record stock removed

On the same Stock page, choose **Correct / remove**. Select the location being corrected and enter the **actual quantity now**, not the amount to subtract. For example, if 10 units were recorded and 2 were given away, enter 8.

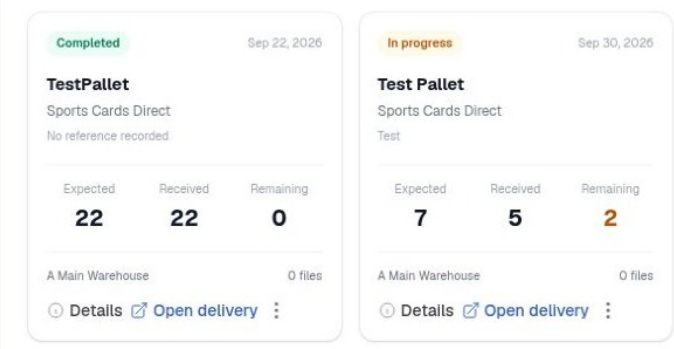

Correct / remove records the quantity that should remain and why it changed.

- Choose the real reason, add a note, and link the related show when applicable. Review the proposed change before choosing **Save Correction**. Check History afterward.

9 Review a vendor's deliveries

Choose **Inventory > Vendors** and open the supplier. Use its **Receiving History** section or link to see that vendor's deliveries, including unfinished receipts. Open a delivery for its files, recorded costs, and discrepancy details.

Vendor receiving history stays scoped to the supplier you opened.

Before finishing a delivery - quick checklist

- Correct vendor, delivery, and reference
- Each received product is matched to the correct manifest line
- Cases and units per case reflect what physically arrived
- Receiving location is correct
- Partial quantities and genuine shortages are recorded clearly
- Costs are recorded or flagged for review
- Manifest, invoice, and relevant photos are attached
- Receiving summary has been reviewed and the saved result checked

When something does not look right

- **Wrong quantity:** recount the physical stock, check its location, and read History before correcting it.
- **Missing part of a delivery:** leave it in progress while stock is still expected; document confirmed shortages on the delivery.
- **Wrong location:** use Move stock. Do not receive the item again just to change its location.
- **Missing or unclear cost:** check the invoice and ask an admin to review the receipt. A blank cost is not evidence that the stock was free.

If your role does not show a required action, ask the inventory admin. Provide the delivery reference or item SKU and explain the issue so it can be reviewed against its history.
